

# Workflow of article in HTML / article or text DTD

## How to generate SGML files (article and text DTD)

### Files specifications

- one document (article or text) by file
- .html
- all the files related to the document must have the same name. For instance, a01.pdf.
- all the *translations* files must have the same name preceded by <lang two letters>\_. For instance, en\_a01.pdf, en\_a01.html.

### Files location

Organize the files according to this files/folders structure.

files for Markup

```
/scielo/serial/<acron>/<issue_identification>/markup
```

body

```
/scielo/serial/<acron>/<issue_identification>/body
```

images

```
/scielo/serial/<acron>/<issue_identification>/img
```

pdf

```
/scielo/serial/<acron>/<issue_identification>/pdf
```

For instance:

```
images/concepts_serial_abc.jpg
```

### Input files for Markup

You must not have /scielo/bin/markup/markup\_journals\_list.csv. If you do, delete it.

Instead, you must have:

- ??\_issue.mds: updated/created as any issue number's data is updated/created
- issue.mds: updated/created as any issue number's data is updated/created
- journal-standard.txt: updated/created as any journal's data is updated/created

These files are generated by [Title Manager](#) or SciELO Manager.

## Markup

Use [Markup Program](#).
